AHK-Cu Hair Growth Protocol

What it is

AHK-Cu (Alanine-Histidine-Lysine Copper) is a copper peptide often used for hair restoration. It may help stimulate hair follicles, improve blood flow to the scalp, reduce inflammation, and support thicker, healthier hair growth.

Typical Course

Minimum: 12 weeks

Ideal: 4–6 months

Hair follicles grow slowly, so most people don't notice significant changes until around 8–12 weeks.

Injectable Protocol

AHK-Cu 50mg vial

Reconstitute with:

5mL bacteriostatic water

This gives:

10mg/mL concentration

Dose:

1mg daily

10 units on a U100 insulin syringe

Subcutaneous injection

One 50mg vial lasts approximately 50 days.

Alternative Higher-Dose Protocol

For aggressive hair restoration:

2mg daily

20 units daily

One vial lasts approximately 25 days.

Stack for Best Results

Hair Regrowth Stack

AHK-Cu 1–2mg daily

GHK-Cu 2mg daily

Collagen peptides

Adequate protein intake (100g+ daily)

Iron, zinc, vitamin D optimization

Optional topical minoxidil if tolerated

What People Typically Notice

Weeks 1–4

Less shedding

Healthier scalp

Weeks 4–8

Reduced hair loss

Improved hair texture

Weeks 8–16

Baby hairs appearing

Increased density

Months 4–6

More noticeable thickening and fullness

Decode Recommendation

For someone serious about hair restoration:

2 boxes AHK-Cu 50mg

2 boxes GHK-Cu 50mg

Run for 90–120 days

Prioritize protein intake, sleep, and mineral status

This tends to produce better results than using AHK-Cu alone because AHK-Cu focuses more on follicle stimulation, while GHK-Cu supports tissue repair, scalp health, and collagen production.
